#### 1. Voevodsky's connectivity theorem for $\mathbb{P}^1$ -spectra

Our goal is to prove theorem 4.14 of [Voev98], which we restate in terms of  $\mathbb{P}^1$ -spectra.

**Theorem 1.1.** Let (X, x) be a pointed smooth scheme over  $\operatorname{Spec}(k)$  where k is an infinite field. Let  $\mathcal Y$  be a pointed space. Then for any  $n > \dim(X)$ , and any integer m

$$\mathcal{SH}(k)(\Sigma^{\infty}X, S^n \wedge \mathbb{G}_m^m \wedge \Sigma^{\infty}\mathcal{Y}) = 0.$$

We will prove this theorem by following [Mor03] and [Mor05] by Fabien Morel.

Remark 1. To prove this theorem, Morel carefully analyzes how to pass from spaces in the projective model structure to the  $\mathbb{A}^1$  stable homotopy category of  $\mathbb{P}^1$  spectra. From the projective model structure on spaces, we construct a model of the left Bousfield localization of spaces at the class of maps  $\{U_+ \wedge \mathbb{A}^1 \to U \mid U \text{ im Sm}/k\}$ . To get to  $\mathbb{P}^1$  spectra, we first invert  $S^1 \wedge -$  to get a category of  $S^1$  spectra, and then we invert  $\mathbb{G}_m \wedge -$  to get a category of  $(\mathbb{G}_m, S^1)$  bispectra.

$$\mathcal{H}_{s,\bullet}(k) \to \mathcal{H}_{\bullet}(k) \to \mathcal{SH}^{S^1}(k) \to \mathcal{SH}(k)$$

The machinery that we set up to prove this theorem will also allow us to establish a t-structure on  $\mathcal{SH}(k)$ , and identify its heart.

Remark 2. A construction of Ayoub [Ayo08] shows that theorem 1.1 statement is false over general Noetherian base schemes S. The argument below works for infinite fields, however.

## 2. Assumptions from previous lectures

We briefly recall some of the basic constructions which appear in [Mor03] and [Mor05].

2.1. Facts about Nisnevich topology. The proof of Voevodsky's connectivity theorem will follow from the following property of Nisnevich sheaf cohomology by a sequence of reductions.

**Proposition 2.1.** [Mor04, 2.4.1] Let M be a sheaf of abelian groups on Sm/k, and let  $X \in \text{Sm}/k$  with Krull dimension d. Then whenever n > d,  $H_{Nis}^n(X; M) = 0$ .

2.2. Unstable model category  $\Delta^{op} \text{Shv}(\text{Sm}/k, Nis)$ .

**Definition 2.2.** Let k be a field, and let Sm/k denote the category of smooth schemes of finite type over k. The category of Morel-Voevodsky spaces over k is the category of simplicial Nisnevich sheaves on Sm/k. We write  $\text{Spc}(k) = \Delta^{op}\text{Shv}(\text{Sm}/k, Nis)$  for this category.

The category  $\operatorname{Spc}(k)$  may be equipped with several different model category structures. We will work with the injective local model category structure on  $\operatorname{Spc}(k)$ , which we now define.

1

**Definition 2.3.** A map  $\mathcal{X} \to \mathcal{Y}$  is an injective weak equivalence if and only if for any  $U \in \text{Sm}/k$ , the map  $\mathcal{X}(U) \to \mathcal{Y}(U)$  is a weak equivalence of simplicial sets.

A map  $\mathcal{X} \to \mathcal{Y}$  is an injective cofibration if and only if for any  $U \in \text{Sm}/k$ , the map  $\mathcal{X}(U) \to \mathcal{Y}(U)$  is a cofibration of simplicial sets, i.e., a monomorphism.

A map  $\mathcal{X} \to \mathcal{Y}$  is an injective fibration if and only if it satisfies the left lifting property with respect to any trivial injective cofibration. That is, for any commutative square below with  $\mathcal{A} \to \mathcal{B}$  a trivial cofibration, a lift  $\mathcal{B} \to \mathcal{X}$  exists.

$$\begin{array}{ccc}
\mathcal{A} \longrightarrow \mathcal{X} \\
 & \downarrow \\
 & \downarrow \\
\mathcal{B} \longrightarrow \mathcal{Y}
\end{array}$$

Denote the homotopy category associated to the injective model category structure on  $\operatorname{Spc}(k)$  by  $\mathcal{H}_s(k)$ . The "s" stands for simplicial.

**Definition 2.4.** The category of pointed space  $\operatorname{Spc}_{\bullet}(k)$  inherits a model category structure from  $\operatorname{Spc}(k)$ . The functor  $-_+:\operatorname{Spc}(k)\to\operatorname{Spc}_{\bullet}(k)$  defined by adding a disjoint basepoint to a given space is a left Quillen functor. The right adjoint is the forgetful functor.

**Proposition 2.5.** Every object of  $\operatorname{Spc}(k)$  and  $\operatorname{Spc}_{\bullet}(k)$  is cofibrant in the injective model category structure.

**Definition 2.6.** For  $X \in \text{Sm}/k$ , let rX denote the sheaf associated to the presheaf  $U \mapsto \text{Sm}/k(U,X)$ . This defines a functor  $r : \text{Sm}/k \to \text{Spc}(k)$ .

For K a simplicial set, the constant space  $cK \in \operatorname{Spc}(k)$  is the sheaf associated to the constant presheaf with value K. The functor  $c : \operatorname{\underline{sSet}} \to \operatorname{Spc}(k)$  is a left Quillen functor with right adjoint given by taking sections at  $\operatorname{Spec} k$ .

**Proposition 2.7.** Spc(k) is a simplicial model category.

See [Pel08, Chapter 2] for a detailed treatment of the products and internal hom constructions in  $\operatorname{Spc}(k)$ . We recount those definitions which are essential to our argument.

**Definition 2.8.** For spaces  $\mathcal{X}$  and  $\mathcal{Y}$ , the product  $\mathcal{X} \times \mathcal{Y}$  in  $\operatorname{Spc}(k)$  is given by  $U \mapsto \mathcal{X}(U) \times \mathcal{Y}(U)$ . For spaces  $\mathcal{X}$  and  $\mathcal{Y}$ , the internal hom  $\operatorname{\underline{Hom}}(\mathcal{X}, \mathcal{Y})$  in  $\operatorname{Spc}(k)$  is given by the formula

$$(U, m) \in \operatorname{Sm}/k \times \Delta \mapsto \operatorname{Hom}_{\Delta^{op}\operatorname{Shy}}(X \times rU \times c\Delta^n, Y).$$

**Proposition 2.9.** The product and internal hom defined above give  $\operatorname{Spc}(k)$  the structure of a closed monoidal model category. See [H-Mod, Chapter 4] or [Pel08,  $\S 1.7$ ] for the definition.

*Proof.* The adjunction between  $\mathcal{X} \times -$  and  $\underline{Hom}(\mathcal{X}, -)$  is given by the following map.

$$\eta: \operatorname{Hom}(\mathcal{Y}, \underline{Hom}(\mathcal{X}, \mathcal{Z})) \xrightarrow{\cong} \operatorname{Hom}(\mathcal{X} \times \mathcal{Y}, \mathcal{Z})$$

For  $g \in \text{Hom}(\mathcal{Y}, \underline{Hom}(\mathcal{X}, \mathcal{Z}))$ , we define  $\eta(g)$  by

$$\mathcal{X}_n(U) \times \mathcal{Y}_n(U) \xrightarrow{\eta(g)(U,n)} \mathcal{Z}_n(U)$$

$$(a,b) \longmapsto q(U,n)(b)(U,n)(a,\mathrm{id}_U,\mathrm{id}_{\Delta^n}).$$

For  $f: \mathcal{X} \times \mathcal{Y} \to \mathcal{Z}$ , the map  $(\eta^{-1}f)(U,n): \mathcal{Y}_n(U) \to \underline{Hom}(\mathcal{X},\mathcal{Z})_n(U)$  is given by sending  $y \in \mathcal{Y}_n(U)$  to the map

$$\mathcal{X}_{m}(V) \times \operatorname{Sm}/k(V, U) \times \Delta_{m}^{n} \xrightarrow{(\eta^{-1}f)(U, n)(y)(V, m)} \mathcal{Z}_{m}(V)$$

$$(x, \phi, \alpha) \longmapsto f(V, m)(x, \mathcal{Y}(\phi)(y \circ \alpha))$$

where we identify y with a map  $y: \Delta^n \to \mathcal{Y}(V)$ , and  $\alpha: \Delta^m \to \Delta^n$ .

**Definition 2.10.** Let  $\mathcal{X}$  and  $\mathcal{Y}$  be spaces. For a point  $x \in \mathcal{X}$ , there is an evaluation map  $ev_x : \underline{Hom}(\mathcal{X}, \mathcal{Y}) \to \mathcal{Y}$ , where at  $(U, n) \in (\mathrm{Sm}/k \times \Delta)^{op}$  we send  $g : \mathcal{X} \times rU \times c\Delta^n \to \mathcal{Y}$  to  $g(U, n)(x, \mathrm{id}, \mathrm{id}) \in \mathcal{Y}_n(U)$ .

For pointed spaces  $(\mathcal{X}, x)$  and  $\mathcal{Y}, y$ , the pointed internal hom  $\underline{Hom}_{\bullet}(\mathcal{X}, \mathcal{Y})$  is the fiber of  $ev_x$  over y, i.e.,  $ev_x^{-1}(y)$ .

**Definition 2.11.** Let  $(\mathcal{X}, x)$  and  $(\mathcal{Y}, y)$  be pointed spaces. The wedge of  $\mathcal{X}$  and  $\mathcal{Y}$ , denoted by  $\mathcal{X} \vee \mathcal{Y}$ , is the pushout of the following diagram.

$$pt \xrightarrow{x} \mathcal{X}$$

$$\downarrow^{y} \qquad \downarrow$$

$$\mathcal{Y} \longrightarrow \mathcal{X} \vee \mathcal{Y}$$

The smash product  $\mathcal{X} \wedge \mathcal{Y}$  is the space given by the pushout of the following diagram, with basepoint  $\mathcal{X} \vee \mathcal{Y}$ .

$$\begin{array}{ccc} \mathcal{X} \vee \mathcal{Y} \longrightarrow \mathcal{X} \times \mathcal{Y} \\ \downarrow & & \downarrow \\ pt \longrightarrow \mathcal{X} \wedge \mathcal{Y} \end{array}$$

**Proposition 2.12.** The category of pointed spaces  $\operatorname{Spc}_{\bullet}(k)$  is also a closed monoidal category with product  $\wedge$  and internal hom  $\operatorname{\underline{Hom}}_{\bullet}$ .

# 2.3. $\mathbb{A}^1$ localization.

**Definition 2.13.** A space  $\mathcal{X}$  is called  $\mathbb{A}^1$  local if for any smooth scheme U, the canonical map

$$\operatorname{Hom}(rU,\mathcal{X}) \to \operatorname{Hom}(rU \times \mathbb{A}^1,\mathcal{X})$$

is a bijection.

**Definition 2.14.** A map  $f: \mathcal{X} \to \mathcal{Y}$  is an  $\mathbb{A}^1$  weak equivalence if

$$\operatorname{Hom}(\mathcal{Y}, \mathcal{Z}) \to \operatorname{Hom}(\mathcal{X}, \mathcal{Z})$$

is a bijection for every  $\mathbb{A}^1$  local space  $\mathbb{Z}$ .

The unstable motivic homotopy category is obtained by left Bousfield localization of the injective model category structure on spaces with respect to the class of maps  $W = W_{\mathbb{A}^1} = \{U \times \mathbb{A}^1 \to U \,|\, U \in \operatorname{Sm}/k\}$ . We deonte the category of spaces with the model structure obtained by left Bousfield localization by  $L_W\operatorname{Spc}(k)$  and its homotopy category by  $\mathcal{H}(k)$ . See [Hir, Chapter 3] for the general theory of Bousfield localization. One thing we obtain is a localization functor  $L_{\mathbb{A}^1} : \mathcal{H}_s(k) \to \mathcal{H}(k)$  which is a left Quillen functor. In particular,  $L_{\mathbb{A}^1}$  sends sends  $\mathbb{A}^1$  weak equivalences to isomorphisms.

The model category  $L_W \operatorname{Spc}(k)$  is constructed as follows. The underlying category of  $L_W \operatorname{Spc}(k)$  is  $\operatorname{Spc}(k)$ , but the weak equivalences are the  $\mathbb{A}^1$ -local weak equivalences. The cofibrations are the cofibrations in the injective model structure on  $\operatorname{Spc}(k)$ . The fibrations are what they need to be, i.e., those maps which satisfy the left lifting property with respect to trivial cofibrations.

In order to effectively work with the  $\mathcal{H}(k)$ , we require a means of constructing fibrant replacements in  $L_W \operatorname{Spc}(k)$ . Morel accomplishes this by constructing another model category with homotopy category  $\mathcal{H}(k)$ .

**Definition 2.15.** Let  $\operatorname{Spc}^{\mathbb{A}^1}(k)$  denote the full subcategory of  $\operatorname{Spc}(k)$  of  $\mathbb{A}^1$  local spaces. The inclusion  $\operatorname{Spc}^{\mathbb{A}^1}(k) \to \operatorname{Spc}(k)$  is a left Quillen functor with left adjoint  $L^{\infty}$ . See [Mor05, Proposition 3.2.3] for the construction.

**Proposition 2.16.** The homotopy category of  $\operatorname{Spc}^{\mathbb{A}^1}(k)$  is equivalent to  $\mathcal{H}(k)$ .

**Definition 2.17.** Let  $\mathcal{X}$  be a space. Define  $\pi_0(\mathcal{X})$  to be the sheaf on  $\mathrm{Sm}/k$  associated to  $U \to \pi_0(\mathcal{X}(U))$ . A space  $\mathcal{X}$  is called 0-connected if and only if  $\pi_0(\mathcal{X})$  is the trivial sheaf.

Let  $(\mathcal{X}, x)$  be a pointed space. Define  $\pi_n(\mathcal{X})$  to be the sheafification of the presheaf on  $\mathrm{Sm}/k$  given by

$$U \to \pi_n(\mathcal{X}(U)).$$

A pointed space  $\mathcal{X}$  is called *n*-connected if it is 0-connected and for all  $i \leq n$ , the sheaves  $\pi_i(\mathcal{X})$  are trivial.

**Proposition 2.18.** Let  $\mathcal{X}$  be a 0-connected simplicial sheaf. Then  $L^{\infty}\mathcal{X}$  is also 0-connected.

For a sheaf of abelian groups M on  $\mathrm{Sm}/k$  and a natural number n, a Dold-Kan construction gives a simplifical presheaf K(M,n). It is called the Eilenberg-MacLane spectrum of type (M,n) and has homotopy sheaves as expected.

$$\pi_m(K(M,n)) = \begin{cases} 0 & \text{if } m \neq n \\ M & \text{if } m = n \end{cases}$$

**Proposition 2.19.** For  $X \in \text{Sm}/k$  and M a sheaf of Abelian groups,

$$\mathcal{H}_s(k)(rX, K(M, n)) \cong H^n_{Nis}(X; M).$$

It therefore follows that

$$\mathcal{H}_{\bullet}(k)(rX_{+},K(M,n)) \cong H^{n}_{Nis}(X;M).$$

**Notation 1.** For a pointed space  $\mathcal{X}$ , Let  $\pi_n^{\mathbb{A}^1}(\mathcal{X})$  denote the sheaf of homotopy groups in the motivic category, i.e.,  $\pi_n^{\mathbb{A}^1}(\mathcal{X}) = \pi_n(L^{\infty}\mathcal{X})$ . The sheaf  $\pi_n^{\mathbb{A}^1}(\mathcal{X})$  is also the sheafification of the presheaf given by

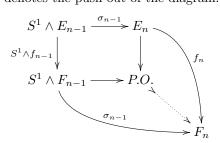

$$U \in \operatorname{Sm}/k \mapsto \mathcal{H}_{\bullet}(k)(S^n \wedge U_+, \mathcal{X}).$$

2.4.  $S^1$  spectra. The functor  $\Sigma_s : \operatorname{Spc}_{\bullet}(k) \to \operatorname{Spc}_{\bullet}(k)$  given by  $\Sigma_s \mathcal{X} = S^1 \wedge \mathcal{X}$  is a left Quillen functor on  $\operatorname{Spc}_{\bullet}(k)$ , with right adjoint  $\Omega_s$ , where  $\Omega_s \mathcal{X} = \operatorname{\underline{Hom}}_{\bullet}(S^1, \mathcal{X})$ . This follows since  $S^1$  is a cofibrant object of  $\operatorname{Spc}_{\bullet}(k)$ . Note, however, that the derived functor  $\Sigma_s$  is not an equivalence of homotopy categories. We may invert this functor, i.e., make a new category where  $\Sigma_s$  is an equivalence of homotopy categories, by creating a category of  $S^1$  spectra by using the general machinery developed in [H-Spt]. Here the "s" in  $\Sigma_s$  and  $\Omega_s$  stands for "simplicial circle".

**Definition 2.20.** Let  $\operatorname{Spt}^{S^1}(k)$  denote the category of  $S^1$  spectra of spaces over k. An object  $E \in \operatorname{Spt}^{S^1}(k)$  is a sequence of pointed spaces  $E_i \in \operatorname{Spc}_{\bullet}(k)$  equipped with bonding maps  $\sigma_i : S^1 \wedge E_i \to E_{i+1}$ . A map of spectra  $f : E \to F$  consists of a sequence of maps of spaces  $f_i : E_i \to F_i$  which are compatible with the bonding maps.

We first endow this category with the projective model structure (or level-wise model structure), i.e., a map  $f: E \to F$  is a weak equivalence if for any n the map  $f_n: E_n \to F_n$  is a w.e.; a map  $f: E \to F$  is a fibration if for all n the map  $f_n: E_n \to F_n$  is a fibration. The cofibrations are those maps satisfying the right lifting property with respect to trivial fibrations.

The projective cofibrations have the following characterization [H-Spt, Proposition 1.15]. A map  $f: E \to F$  is a projective cofibration if and only if  $f_0: E_0 \to F_0$  is a cofibration and for any  $n \geq 1$ , the dotted arrow in the diagram below is a cofibration. Here P.O. denotes the push-out of the diagram.

This model structure does not actually invert  $\Sigma_s$ . To accomplish this, we must localize with respect to the stable equivalences.

**Definition 2.21.** A map  $f: E \to F$  of  $S^1$  spectra is a stable equivalence if for any  $n \in \mathbb{Z}$  the induced map of homotopy sheaves  $\pi_n(f): \pi_n(E) \to \pi_n(F)$  is an isomorphism.

The stable model category structure on  $\operatorname{Spt}^{S^1}(k)$  is given by declaring the weak equivalences to be the stable weak equivalences, and the cofibrations to be the same as those for the projective model structure. This is indeed a left Bousfield localization, but we will not describe it further as such. Consult [H-Spt] for more details.

Denote the homotopy category of  $\operatorname{Spt}^{S^1}(k)$  by  $\mathcal{SH}_s^{S^1}(k)$ .

**Definition 2.22.** Consider the class of maps  $W = \{\Sigma^{\infty}U_{+} \land \mathbb{A}^{1} \to \Sigma^{\infty}U_{+} \mid U \in \text{Sm}/k\}$  in  $\text{Spt}^{S^{1}}(k)$ . The left Bousfield localization of  $\text{Spt}^{S^{1}}(k)$  with respect to W exists, and we write  $L_{W}\text{Spt}^{S^{1}}(k)$  for the resulting model category. Denote the homotopy category associated to  $L_{W}\text{Spt}^{S^{1}}(k)$  by  $\mathcal{SH}^{S^{1}}(k)$ .

Remark 3. Let  $\operatorname{Spt}^{S^1,\mathbb{A}^1}(k)$  denote the full subcategory of  $\operatorname{Spt}^{S^1}(k)$  consisting of  $\mathbb{A}^1$ -local spectra. The inclusion  $\operatorname{Spt}^{S^1,\mathbb{A}^1}(k) \to \operatorname{Spt}^{S^1}(k)$  has a left adjoint  $L^\infty$  which has a similar construction as was considered for spaces. This adjunction is indeed a Quillen functor, and so just as in the unstable setting, we may identify the stable  $\mathbb{A}^1$  homotopy category with the homotopy category of the  $\mathbb{A}^1$ -local  $S^1$  spectra. See [Mor05, §4.2] for details.

For  $S^1$  spectra E and F, we calculate the stable  $\mathbb{A}^1$  homotopy group  $\mathcal{SH}^{S^1}(k)(E,F)$  by

$$\mathcal{SH}^{S^1}(k)(E,F) = \mathcal{SH}^{S^1}(k)(L^{\infty}E, L^{\infty}F)$$
$$= \mathcal{SH}^{S^1}_s(k)(E, L^{\infty}F)$$

Here we consider the model for  $\mathcal{SH}^{S^1}(k)$  given by Bousfield localization, then translate to the category of  $\mathbb{A}^1$  local spectra using  $L^{\infty}$ . The second equality follows from the Quillen adjunction  $\operatorname{Spt}^{S^1,\mathbb{A}^1}(k) \hookrightarrow \operatorname{Spt}^{S^1}(k)$ .

If we assume E is cofibrant and F is fibrant, we get the formula

$$\mathcal{SH}^{S^1}(k)(E,F) = \operatorname{Spt}^{S^1}(k)(E,L^{\infty}F).$$

**Definition 2.23.** Let E be an  $S^1$  spectrum of spaces. Let  $\pi_n$  denote the sheaf obtained by taking the colimit of the directed system  $\pi_{n+r}(E_r)$  in  $\underline{\mathrm{Ab}}(\mathrm{Sm}/k, Nis)$ . That is,

$$\pi_n(E) = \operatorname{colim}_r \pi_{n+r}(E_r).$$

In particular, for a  $U \in \text{Sm}/k$ , we have

$$\pi_n(E)(U) = \operatorname{colim}_r \pi_{n+r}(E_r)(U).$$

**Definition 2.24.** An  $S^1$  spectrum E is said to be n-connected if for any  $m \leq n$ , the homotopy sheaves  $\pi_m(E)$  are trivial.

**Definition 2.25.** There is a left Quillen functor  $\Sigma_s^{\infty}: \operatorname{Spc}_{\bullet} \to \operatorname{Spt}^{S^1}(k)$  given by  $(\Sigma^{\infty}\mathcal{Y})_n = (S^1)^{\wedge n} \wedge \mathcal{Y}$  where the bonding maps come from associativity of smash product. The right adjoint to this functor is given by "evaluation at 0", i.e.,  $\Omega^{\infty}(E) = E_0$ .

Remark 4. The right derived functor  $R\Omega^{\infty}: \mathcal{SH}_s^{S^1}(k) \to \mathcal{H}_{\bullet}(k)$  is given by the formula

$$R\Omega^{\infty}(E) = \operatorname{colim}_{i} \Omega_{s}^{i} E_{i}.$$

This comes from the fact that fibrant  $S^1$  spectra are exactly the  $\Omega$  spectra, and the description of the fibrant replacement functor.

Remark 5. The left Quillen functor  $\Sigma_s^{\infty}: \operatorname{Spc}_{\bullet}^{\mathbb{A}^1}(k) \to \operatorname{Spt}^{S^1}(k)$  factors through the category of  $\mathbb{A}^1$ -local spaces. This follows by [Mor05, Remark 4.1.3]. Furthermore, since a map  $f \in \operatorname{Spt}^{S^1}(k)(\Sigma^{\infty}\mathcal{X}, E)$  is determined by  $f_0: \mathcal{X} \to E_0$  by the adjunction  $\Sigma_s^{\infty} \dashv \Omega_s^{\infty}$ , one can show that  $\Sigma_s^{\infty}\mathcal{X} \to \Sigma^{\infty}L^{\infty}\mathcal{X}$  is an  $\mathbb{A}^1$ -weak equivalence. So in the case of suspension spectra, we may use  $\Sigma^{\infty}L^{\infty}\mathcal{X}$  as an  $\mathbb{A}^1$  localization. In particular, for any  $n \in \mathbb{Z}$  the sheaf  $\pi_n^{\mathbb{A}^1}\Sigma_s^{\infty}\mathcal{X}$  is isomorphic to  $\pi_n\Sigma^{\infty}L^{\infty}\mathcal{X}$ .

Remark 6. The stable homotopy category is symmetric monoidal, with smash product  $\wedge$  and internal hom <u>Hom</u>. Using symmetric spectra, one can give these constructions on the category of spectra [HSS]. The  $S^1$  stable homotopy category is a triangulated category. The shift is given by  $S^1$  suspension, and distinguished triangles are those triangles isomorphic to the cone of a map

$$X \xrightarrow{f} Y \to C(f) \to X[1].$$

**Proposition 2.26.** Let  $U \in \text{Sm}/k$ ,  $n \in \mathbb{Z}$ , and  $M \in \underline{\text{Ab}}(\text{Sm}/k)$ . Then there is a canonical isomorphism

$$H_{Nis}^{n}(U;M) \to \mathcal{SH}^{S^{1}}(\Sigma^{\infty}U_{+}, HM[n]).$$

This is [Mor05, Lemma 3.2.3].

### 2.5. Weak connectedness.

**Proposition 2.27.** Let k be an infinite field, and consider  $\mathcal{X}$  be a pointed space. If for any finitely generated field F over k,  $\pi_0(\mathcal{X})(F) = 0$ , then the sheaf  $\pi_0(\mathcal{X})$  is trivial.

*Proof.* The proof follows along the lines of [Mor05, Lemma 6.1.3].

Need this result for spectra for the  $\mathbb{G}_m$  loop space calculation.

### 2.6. t-structures.

**Definition 2.28.** Let  $\mathfrak{C}$  be a triangulated category. A *t*-structure on  $\mathfrak{C}$  is a pair of full subcategories  $(\mathfrak{C}_{>0}, \mathfrak{C}_{<0})$  which satisfies

- (1) For any  $X \in \mathfrak{C}_{\geq 0}$  and any  $Y \in \mathfrak{C}_{\leq 0}$ ,  $\operatorname{Hom}_{\mathfrak{C}}(X, Y[-1]) = 0$ .
- (2)  $\mathfrak{C}_{>0}[1] \subseteq \mathfrak{C}_{>0}$  and  $\mathfrak{C}_{<0}[-1] \subseteq \mathfrak{C}_{<0}$
- (3) for any  $X \in \mathfrak{C}$  there exists a distinguished triangle

$$Y \to X \to Z \to Y[1]$$

for which  $Y \in \mathfrak{C}_{>0}$ ,  $Z \in \mathfrak{C}_{<0}[-1]$ ..

The heart of a t-structure is the full subcategory given by  $\mathfrak{C}_{>0} \cap \mathfrak{C}_{<0}$ .

**Definition 2.29.** Define  $\mathcal{SH}_s^{S^1}(k)_{\geq 0}$  to be the full subcategory of  $\mathcal{SH}_s^{S^1}(k)$  consisting of objects E such that  $\pi_n(E) = 0$  whenver n < 0.

Define  $\mathcal{SH}_s^{S^1}(k)_{\leq 0}$  to be the full subcategory of  $\mathcal{SH}_s^{S^1}(k)$  consisting of objects E such that  $\pi_n(E)=0$  whenver n>0.

**Theorem 2.30.** The pair  $(\mathcal{SH}_s^{S^1}(k)_{\geq 0}, \mathcal{SH}_s^{S^1}(k)_{\leq 0})$  is a t-structure on  $\mathcal{SH}_s^{S^1}(k)$ .

Remark 7. For a space  $\mathcal{X}$ , there is a Postnikov tower associated to it

$$\cdots P^n(\mathcal{X}) \to P^{n-1}(\mathcal{X}) \to \cdots \to P^0(\mathcal{X}) \to P^{-1}(\mathcal{X})$$

constructed in [MV99, p. 57]. The main construction needed is the Moore-Postnikov tower of a simplicial set [GJ91, VI.3.4]. For a simplicial set K and  $n \in \mathbb{N}$ , define  $K^{(n)} = \operatorname{im}(K \to \operatorname{cosk}_n K)$ . This is a convenient way to define the Moore construction.

For a space  $\mathcal{X}$ , we then define  $P^n\mathcal{X}$  to be the space given by sheafification of  $U \mapsto \mathcal{X}(U)^{(n)}$ .

Now for E an  $S^1$  spectrum, let  $E_{\leq 0}$  be the spectrum with  $(E_{\leq 0})_n = P^n(E_n)$ . The bonding maps come from the canonical map

$$S^1 \wedge P^n(E_n) \to P^{n+1}(S^1 \wedge E_n).$$

See [Mor05, Lemma 3.2.1] for more on this construction.

### 2.7. Connectivity results.

**Proposition 2.31.** [Mor03, Lemma4.2.4] The functor  $L^{\infty}$ :  $\operatorname{Spt}^{S^1}(k) \to \operatorname{Spt}^{S^1,\mathbb{A}^1}(k)$  identifies the  $\mathbb{A}^1$ -localized  $S^1$  stable homotopy category with the homotopy category of  $\mathbb{A}^1$ -local  $S^1$  spectra.

**Theorem 2.32.** Let k be an infinite field. Consider  $E \in \mathcal{SH}^{S^1}(k)$  and suppose that whenever n < 0 the sheaf  $\pi_n E = 0$ . Then for all n < 0,  $\pi_n L^{\infty} E = 0$ .

**Theorem 2.33.** The pair  $(\mathcal{SH}_{\geq 0}^{S^1}(k), \mathcal{SH}_{\leq 0}^{S^1}(k))$  is a *t*-structure on the category  $\mathcal{SH}^{S^1}(k)$ .

*Proof.* This is just the restriction of the t-structure to the  $\mathbb{A}^1$ -local objects.

**Definition 2.34.** Let M be a sheaf of Abelian groups on  $\mathrm{Sm}/k$  with respect to the Nisnevich topology. We say M is strictly  $\mathbb{A}^1$  invariant if for all  $n \geq 0$  and all  $X \in \mathrm{Sm}/k$ , the map  $H^n_{Nis}(X;M) \to H^m_{Nis}(X \times \mathbb{A}^1;M)$  is an isomorphism. Let  $\underline{\mathrm{Ab}}_{st\mathbb{A}^1}(\mathrm{Sm}/k)$  denote the full subcategory of sheaves of Abelian groups on  $\mathrm{Sm}/k$  in the Nisnevich topology consisting of the strictly  $\mathbb{A}^1$  invariant sheaves.

**Definition 2.35.** If  $M \in \underline{\mathrm{Ab}}(\mathrm{Sm}/k)$  is a sheaf of Abelian groups, the Eilenberg-MacLane spectrum associated to M is the  $S^1$  spectrum HM given by  $HM_n = K(M,n)$ . The bonding maps come from the usual identification of  $\Omega_s K(M,n) \cong K(M,n-1)$ .

**Proposition 2.36.** HM is  $\mathbb{A}^1$  local iff M is strictly  $\mathbb{A}^1$  invariant.

**Proposition 2.37.** The heart of the homotopy t structure is equivalent to the category of strictly  $\mathbb{A}^1$  invariant sheaves.

3. Inverting 
$$\mathbb{G}_m \wedge -$$
;  $\mathbb{P}^1$  spectra

3.1.  $\mathbb{G}_m$  suspension and loops. We always consider  $\mathbb{G}_m$  to be pointed at 1 unless otherwise specified.

**Definition 3.1.** On the category  $\operatorname{Spt}^{S^1}(k)$  equipped with the motivic stable model category structure, there is a functor  $\Sigma_t(-) = \mathbb{G}_m \wedge -$  given by  $\Sigma_t(E)_n = \mathbb{G}_m \wedge E_n$  with the evident structure maps. Smashing with  $\mathbb{G}_m$  is also a functor on the unstable category of pointed spaces, and we give it the same name  $\Sigma_t$ .

**Definition 3.2.** The functor  $\Sigma_t$  on  $\operatorname{Spc}_{\bullet}(k)$  has a right adjoint denoted  $\Omega_t$ . It is given by the formula  $\Omega_t \mathcal{X} = \operatorname{\underline{Hom}}_{\bullet}(\mathbb{G}_m, \mathcal{X})$ .

The functor  $\Sigma_t$  on  $\operatorname{Spt}^{S^1}(k)$  also has a right adjoint  $\Omega_t$  given by the internal hom functor, i.e.,  $\Omega_t E = \operatorname{\underline{Hom}}(\Sigma^{\infty}\mathbb{G}_m, E)$ .

**Proposition 3.3.** The functor  $\Sigma_t$  is a left Quillen functor on  $\operatorname{Spt}^{S^1}(k)$  and on  $\operatorname{Spt}^{S^1,\mathbb{A}^1}(k)$ . Furthermore,  $\Sigma_t$  is a triangulated functor on  $\mathcal{SH}^{S^1}(k)$ .

**Lemma 3.4.** Let  $E \in \operatorname{Spt}^{S^1,\mathbb{A}^1}(k)$  be a -1 connected spectrum. Then  $\Sigma_t E$  is again -1 connected.

*Proof.* The claim is clear when  $E = \Sigma_s^{\infty} \mathcal{X}$  a pointed space, since  $\Sigma_t E = \Sigma_s^{\infty} \mathbb{G}_m \wedge \mathcal{X}$  is still a suspension spectrum, and so -1 connected.

Now consider a general -1 connected spectrum E. By [Mor05, Lemma 3.3.4], E is weak equivalent to hocolim  $E^i$  where  $E^0 = *$ , and for each n, there is a family  $X_{\alpha} \in \text{Sm}/k$  and natural numbers  $n_{\alpha} \geq 0$  for which

$$\vee_{\alpha} \Sigma_{s}^{\infty} X_{\alpha,+}[n_{\alpha}-1] \to E^{n-1} \to E^{n}$$

is an exact triangle. An induction argument establishes that  $\Sigma_t E^n$  is still -1 connected for all n; hence  $\Sigma_t E = \operatorname{hocolim} \Sigma_t E^n$  is also -1 connected. Should  $\Sigma_t E$  fail to be  $\mathbb{A}^1$ -local, we may simply apply  $L^{\infty}$  to get an  $\mathbb{A}^1$ -local representative of  $\Sigma_t E$ . By the connectivity theorem,  $L^{\infty} \Sigma_t E$  will again be -1 connected.

3.2. Contraction in  $\underline{Ab}(Sm/k, Nis)$ , category of pointed sheaves of sets.

**Definition 3.5.** Let G be a sheaf of pointed sets on Sm/k. The contraction of G is the sheaf  $G_{-1}$  given by the formula

$$U \in \operatorname{Sm}/k \mapsto \ker(G(X \times \mathbb{G}_m) \xrightarrow{ev_1} G(X))$$

Where the map  $ev_1$  is the map induced by  $ev_1 : \operatorname{Spec}(k) \to \mathbb{G}_m$ , i.e.,  $k[x, x^{-1}] \to k$  given by  $x \mapsto 1$ .

Note that indeed  $G_{-1}$  is a sheaf since it is the kernel of the morphism of sheaves  $G(-) \to G(-\times \mathbb{G}_m)$ . The sheaf  $G(-\times \mathbb{G}_m)$  may also be written as  $\underline{\text{Hom}}(\mathbb{G}_m, G)$  when we think of G as a space.

**Proposition 3.6.** If G is the trivial sheaf of abelian groups, then so is its contraction  $G_{-1}$ .

**Proposition 3.7.** Contraction is an exact functor on the category  $\underline{Ab}_{st\mathbb{A}^1}(\mathrm{Sm}/k, Nis)$ . For any sheaf  $G \in \underline{Ab}(\mathrm{Sm}/k, Nis)$  and any  $X \in \mathrm{Sm}/k$ ,  $G(\mathbb{G}_m \times X) = G_{-1}(X) \oplus G(X)$ .

## 3.3. Homotopy sheaves of $\underline{Hom}(\mathbb{G}_m, E)$ .

**Proposition 3.8.** If G is a sheaf of Abelian groups, then  $G_{-1} = \underline{\operatorname{Hom}}_{\bullet}(\mathbb{G}_m, G)$ . Hence contraction is right adjoint to  $- \wedge \mathbb{G}_m$ . The claim is also true for pointed sheaves of sets.

*Proof.* For this category,  $\underline{\operatorname{Hom}}_{\bullet}(\mathbb{G}_m, G)$  and  $G_{-1}$  both have sections at X given by  $\ker(\operatorname{ev}_1: G(X \times \mathbb{G}_m) \to G(X))$ . See description of pointed internal hom for this.

Remark 8. If G is a sheaf of Abelian groups, we may consider G as a space by declaring  $G_n = G$  for all n and giving identity maps for the structure maps. In particular, G is a pointed space at 0.

We can then realize the contraction as a  $\mathbb{G}_m$  loop space  $G_{-1}(X) = \underline{\mathrm{Hom}}_{\bullet}(\mathbb{G}_m, G)(X)$ .

Remark 9. We now describe the construction of the canonical map  $\pi_n(\underline{\text{Hom}}(\mathbb{G}_m, E)) \to \pi_n(E)_{-1}$  for an  $S^1$  spectrum E.

First observe that for any  $U \in \text{Sm}/k$  and any  $n \in \mathbb{Z}$  there is a map

$$\operatorname{Spt}_{\mathfrak{s}}(k)(S^n \wedge \Sigma_{\mathfrak{s}}^{\infty}U_+ \wedge \Sigma^{\infty}\mathbb{G}_m, E) \times \operatorname{Spc}(k)(U, \mathbb{G}_m) \to \pi_0(E)(U)$$

given by sending  $(f, \alpha)$  to the composition

$$\Sigma_s^{\infty} U_+ \xrightarrow{\operatorname{id} \wedge \Sigma_s^{\infty} \alpha} S^n \wedge \Sigma_s^{\infty} U_+ \wedge \Sigma_s^{\infty} \mathbb{G}_m \longrightarrow E.$$

Hence there is a map of sheaves

$$\pi_n(\underline{\operatorname{Hom}}(\mathbb{G}_m, E)) \times \mathbb{G}_m \to \pi_n(E).$$

This map descends to the smash product, so we have

$$\pi_n(\operatorname{Hom}(\mathbb{G}_m, E)) \wedge \mathbb{G}_m \to \pi_n(E).$$

But by the adjunction  $-\wedge \mathbb{G}_m \dashv \underline{\mathrm{Hom}}_{\bullet}(\mathbb{G}_m, -)$  on  $\mathrm{Spc}_{\bullet}(k)$  we have a morphism

$$\pi_n(\underline{\operatorname{Hom}}(\mathbb{G}_m, E)) \to \underline{\operatorname{Hom}}_{\bullet}(\mathbb{G}_m, \pi_n(E)) = \pi_n(E)_{-1}.$$

Remark 10. If E = HM is an Eilenberg-MacLane spectrum associated to a strictly  $\mathbb{A}^1$  invariant sheaf of abelian groups M, we show

$$\pi_n(\underline{\operatorname{Hom}}(\mathbb{G}_m, HM)) \to \underline{\operatorname{Hom}}_{\bullet}(\mathbb{G}_m, \pi_n(HM)) = \pi_n(HM)_{-1}.$$

is an isomorphism by showing  $\underline{\mathrm{Hom}}(\mathbb{G}_m, HM)$  is an Eilenberg-MacLane spectrum.

**Proposition 3.9.** For  $M \in \underline{\mathrm{Ab}}_{st\mathbb{A}^1}(\mathrm{Sm}/k)$ , the spectrum  $\underline{\mathrm{Hom}}(\mathbb{G}_m, HM)$  is weak equivalent to  $H(M_{-1})$ .

*Proof.* Since  $\mathbb{P}^1 = S^1 \wedge \mathbb{G}_m$  in  $\mathcal{H}_{\bullet}(k)$ , we have  $\Sigma^{\infty} \mathbb{P}^1[-1] = \Sigma^{\infty} \mathbb{G}_m$ . Therefore

$$\begin{split} \mathcal{SH}_s^{S^1}(k)(\Sigma^\infty\mathbb{G}_m, HM[n]) &= \mathcal{SH}_s^{S^1}(k)(\Sigma^\infty\mathbb{P}^1[-1], HM[n]) \\ &= \mathcal{SH}_s^{S^1}(k)(\Sigma^\infty\mathbb{P}^1, HM[n+1]) \\ &= \tilde{H}_{Nis}^{n+1}(\mathbb{P}^1; M). \end{split}$$

As the cohomological dimension of  $\mathbb{P}^1$  is less than or equal to 1, we then have  $\tilde{H}_{Nis}^{n+1}(\mathbb{P}^1;M)=0$  for all  $n\neq 0$ . By  $\tilde{H}_{Nis}^n(X;M)$  I mean the kernel of  $\mathcal{SH}_s^{S^1}(k)(\Sigma^{\infty}X_+,HM[n])\to 0$ 

give ref

 $\mathcal{SH}_s^{S^1}(k)(\Sigma^{\infty}S^0, HM[n])$  induced by  $S^0 \to X_+$ , where this is obtained by choosing a point in X(k). But what if X(k) is empty?

$$\tilde{H}^n(X;M) \oplus H^n(\operatorname{Spec}(k);M) \cong H^n(X;M).$$

So as  $M(\operatorname{Spec} k) \cong M(\mathbb{P}^1)$  (follows since M is strictly  $\mathbb{A}^1$  invariant)  $M(\mathbb{P}^1) =$  $pullback(M(\mathbb{A}^1) \to M(\mathbb{G}_m) \to M(\mathbb{A}^1) = M(\operatorname{Spec} k)),$  we see that the only possible value of n this will not vanish at is 1.

Since this vanishes at fields, a base change argument shows that indeed the sheaf  $\pi_n \operatorname{Hom}(\mathbb{G}_m, HM)$  is weakly trivial when  $n \neq 0$ . So then it follows that the sheaf is indeed trivial by the argument giving weakly n-connected is equivalent to being n-connected.<sup>1</sup>

We now calculate at Spec(k)

$$\pi_0 \underline{\operatorname{Hom}}(\mathbb{G}_m, HM)(Spec(k)) = \mathcal{SH}_s^{S^1}(k)(\Sigma^{\infty}\mathbb{G}_m, HM)$$

$$= \tilde{H}^0(\mathbb{G}_m; M)$$

$$= \ker(\mathcal{SH}_s^{S^1}(k)(\Sigma^{\infty}\mathbb{G}_{m,+}, HM) \to \mathcal{SH}_s^{S^1}(k)(\Sigma^{\infty}S^0, HM))$$

$$= M_{-1}(\operatorname{Spec} k)$$

We now know that the associated homotopy sheaves  $\pi_n \underline{\mathrm{Hom}}(\mathbb{G}_m, HM)$  and  $\pi_n H(M_{-1})$  agree for all n. So they are weak equivalent by [Mor05, Lemma 3.2.5].

**Proposition 3.10.** For any spectrum  $E \in \mathcal{SH}^{S^1}(k)$ , the homotopy sheaves of  $\operatorname{Hom}(\mathbb{G}_m, E)$  are calculated by  $\pi_n(\operatorname{Hom}(\mathbb{G}_m, E)) \cong \pi_n(E)_{-1}$ 

Proof. Reduce to the case of Eilenberg-MacLane spectra by using the Postnikov tower.

3.4. Inverting  $\mathbb{G}_m \wedge -$ ;  $(\mathbb{G}_m, S^1)$  bi-spectra. The functor  $\Sigma_t$  on  $\operatorname{Spt}^{S^1}(k)$  is a left Quillen functor. We may therefore apply the general machinery of [H-Spt] to create a model category in which  $\Sigma_t$  is invertible. The construction of Hovey may be described as  $(\mathbb{G}_m, S^1)$  bispectra.

**Definition 3.11.** A  $(\mathbb{G}_m, S^1)$  bi-spectrum of spaces over k consists of a bigraded family of spaces  $E_{i,j}$ ,  $i, j \geq 0$ , equipped with structure maps  $\sigma_{i,j}: S^1 \wedge E_{i,j} \to E_{i,j+1}$ and  $\mu_{i,j}: \mathbb{G}_m \wedge E_{i,j} \to E_{i+1,j}$  for which the following diagram commutes .

$$S^{1} \wedge \mathbb{G}_{m} \wedge E_{i,j} \xrightarrow{S^{1} \wedge \tau_{i,j}} S^{1} \wedge E_{i+1,j}$$

$$\downarrow \qquad \qquad \downarrow \qquad$$

Let  $\operatorname{Spt}^{(\mathbb{G}_m,S^1)}(k)$  denote the category of bispectra.

<sup>&</sup>lt;sup>1</sup>Reword this to use the modified lemma with gabber presentation.

Remark 11. Note that a  $(\mathbb{G}_m, S^1)$  bispectrum is just a  $\mathbb{G}_m$ -spectrum of  $S^1$  spectra. So we may therefore equip it with the projective stable model structure we get from this perspective. We may therefore think of a  $(\mathbb{G}_m, S^1)$  bi-spectrum  $E_{i,j}$  as a sequence of  $S^1$  spectra  $E_{i,*}$ .

**Definition 3.12.** Let E be a  $(\mathbb{G}_m, S^1)$  bispectrum. Define the bigraded stable homotopy presheaf  $\tilde{\pi}_{n+m\alpha}$  by the formula

$$U \in \operatorname{Sm}/k \mapsto \operatorname{colim}_r \mathcal{H}_{\bullet}(k)(S^{n+r} \wedge \mathbb{G}_m^{r+m} \wedge U_+, E_{r,r}).$$

Morel's notation is  $\tilde{\pi}_n(E)_m = \tilde{\pi}_{n-m\alpha}$ . We may also write  $\tilde{\pi}_{n,m}(E) = \tilde{\pi}_{n-m+m\alpha}(E)$ . We denote the associated Nisnevich sheaf by  $\pi_{n+m\alpha}(E)$ .

**Proposition 3.13.** If E is a  $(\mathbb{G}_m, S^1)$  bispectrum, the presheaf of homotopy groups may also be calculated as

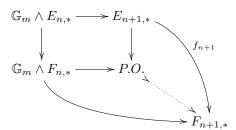

$$\tilde{\pi}_{n+m\alpha}E(U) = \operatorname{colim}_{s,r} \mathcal{H}_{\bullet}(k)(\mathbb{G}_m^{s+m} \wedge S^{n+r} \wedge U_+, E_{r,s}).$$

[DLØRV, p 217]

**Definition 3.14.** A morphism  $f: E \to F$  of  $(\mathbb{G}_m, S^1)$  bispectra is an  $\mathbb{A}^1$  stable weak equivalence if the following induced map is an isomorphism for all  $U \in \text{Sm}/k$ .

$$f_*: \tilde{\pi}_{n+m\alpha}(E)(U) \to \tilde{\pi}_{n+m\alpha}(F)(U)$$

**Definition 3.15.** A morphism  $f: E \to F$  of  $(\mathbb{G}_m, S^1)$  bispectra is an  $\mathbb{A}^1$  stable cofibration if  $f_0: E_{0,*} \to F_{0,*}$  is a cofibration of  $S^1$  spectra and the map  $P.O. \to F_{n+1}$  is a cofibration in the following diagram.

**Proposition 3.16.** The category  $\operatorname{Spt}^{(\mathbb{G}_m,S^1),\mathbb{A}^1}(k)$  of  $(\mathbb{G}_m,S^1)$  bispectra with  $\mathbb{A}^1$  stable weak equivalences and  $\mathbb{A}^1$  stable cofibrations is a model category. Denote the associated homotopy category of  $\operatorname{Spt}^{(\mathbb{G}_m,S^1),\mathbb{A}^1}(k)$  by  $\mathcal{SH}(k)$ .

**Proposition 3.17.** The fibrant bi-spectra are the  $\Omega_t$ -spectra. [H-Spt, Theorem 3.4]

**Proposition 3.18.** There is a left Quillen functor  $\Sigma_t^{\infty} : \operatorname{Spt}_s^{\mathbb{A}^1}(k) \to \operatorname{Spt}_{s,t}^{\mathbb{A}^1}(k)$  given by  $(\Sigma_t^{\infty} E)_{i,j} = \mathbb{G}_m^i \wedge E_j$  with bonding maps

$$S^1 \wedge \mathbb{G}_m^i \wedge E_j \longrightarrow \mathbb{G}_m^i \wedge S^1 \wedge E_j \longrightarrow \mathbb{G}_m \wedge E_{j+1}$$

and

$$\mathbb{G}^m \wedge \mathbb{G}_m^i \wedge E_j \to \mathbb{G}_m^{i+1} E_j.$$

The right adjoint to  $\Sigma_t^{\infty}$  is denoted by  $\Omega_t^{\infty}$  and is given by  $\Omega_t^{\infty}(E) = E_{0,*}$ .

The right derived functor  $R\Omega_t^{\infty}(E)$  is given by the formula

$$R\Omega_t^{\infty}(E) = \operatorname{colim}_i \Omega_t^i E_{i,*}.$$

3.5. Connectivity of  $(\mathbb{G}_m, S^1)$  bispectra.

**Definition 3.19.** A  $(\mathbb{G}_m, S^1)$  bispectrum E is said to be n-connected if for all  $k \leq n$  and all  $m \in \mathbb{Z}$ , the homotopy sheaves  $\pi_{k+m\alpha}E$  vanish.

**Proposition 3.20.** Let  $E \in \operatorname{Spt}^{S^1,\mathbb{A}^1}(k)$ . If E is -1 connected, then so too is the  $(\mathbb{G}_m, S^1)$  bi-spectrum  $\Sigma_t^{\infty} E$ .

Proof. We calculate

$$\begin{split} \pi_{n+m\alpha}(\Sigma_t^\infty E) &= \pi_n(R\Omega_t^\infty \Omega_t^m \Sigma_t^\infty E) \\ &= \pi_n(\operatorname{colim}_i \Omega_t^{m+i} \Sigma_t^i E) \\ &= \operatorname{colim}_i \pi_n(\Sigma_t^i E)_{-(m+i)} \\ &= 0. \end{split}$$

This follows since  $\Sigma_t E$  is -1 connected whenever E is -1 connected, and the effect of  $\Omega_t^{m+i}$  on homotopy sheaves is contraction.

3.6. t-structure on SH(k).

**Definition 3.21.** Let  $\mathcal{SH}(k)_{\geq 0}$  denote the full subcategory of  $\mathcal{SH}(k)$  given by bispectra E satisfying  $\pi_{n+m\alpha}E=0$  whenever n<0.

Let  $\mathcal{SH}(k)_{\leq 0}$  denote the full subcategory of  $\mathcal{SH}(k)$  given by bispectra E satisfying  $\pi_{n+m\alpha}E=0$  whenever n>0.

**Definition 3.22.** For a  $(\mathbb{G}_m, S^1)$  bispectrum E, let  $E_{\leq 0}$  denote the spectrum with  $(E_{\leq 0})_n = (E_n)_{\leq 0}$ . The bonding maps are given by

$$\mathbb{G}_m \wedge P^j(E_{i,j}) \cong P^j(\mathbb{G}_m \wedge E_{i,j}) \to P^j(E_{i+1,j}).$$

The equivalence  $\mathbb{G}_m \wedge P^j(\mathcal{X}) \cong P^j(\mathbb{G}_m \wedge \mathcal{X})$  follows by checking on stalks, and the fact that any stalk of  $\mathbb{G}_m$  is just a disjoint union of points.

**Theorem 3.23.** The pair  $(\mathcal{SH}(k)_{>0}, \mathcal{SH}(k)_{<0})$  defines a t-structure on  $\mathcal{SH}(k)$ .

*Proof.* Property (2) of a t-structure is clear.

We now establish property (1) of a t-structure. Let  $E \in \mathcal{SH}(k)_{\geq 0}$  and  $F \in \mathcal{SH}(k)_{\leq 0}$ . We must show  $\mathcal{SH}(k)(E, F[-1]) = 0$ . When E is in the image of  $\Sigma_t^{\infty}$ , the result follows by using the adjuction  $\Sigma_t^{\infty} \dashv R\Omega_t^{\infty}$  and using the t-structure on  $S^1$  spectra. In particular, for  $U \in \text{Sm}/k$  we have  $\mathcal{SH}(k)(S^n \wedge \mathbb{G}_m^m \wedge \Sigma^{\infty}U_+, F[-1]) = 0$  for  $n \geq 0$  and  $m \in \mathbb{Z}$ .

For a general  $E \in \mathcal{SH}(k)_{\geq 0}$ , we may write  $E = \text{hocolim } E^i$  where the  $E^i$  are built up as in [Mor05, 3.3.4], but we allow smashing with  $\mathbb{G}_m$ . Precisely, we take  $E^0 = pt$ , and each  $E^i$  is obtained from  $E^{i-1}$  as the cone of a map

$$\bigvee_{\alpha} S^{n_{\alpha}} \wedge \mathbb{G}_{m}^{m_{\alpha}} \wedge \Sigma^{\infty} X_{\alpha,+} \to E^{i-1}$$

for some family of  $X_{\alpha} \in \text{Sm}/k$  and indices  $n_{\alpha} \geq 0$ ,  $m_{\alpha} \in \mathbb{Z}$ .

A standard 5-lemma argument using the long exact sequence obtained by applying  $\mathcal{SH}(k)(-, F[-1])$  to the triangle

$$\forall S^{n_{\alpha}} \wedge \mathbb{G}_{m}^{m_{\alpha}} \wedge \Sigma^{\infty} X_{\alpha,+} \to E^{i-1} \to E^{i}$$

shows that for all  $i \in \mathbb{N}$ ,  $\mathcal{SH}(k)(E^i, F[-1]) = 0$ . Furthermore, these long exact sequences show that for all  $i \geq 1$ ,  $\mathcal{SH}(k)(E^i, F[-2]) \to \mathcal{SH}(k)(E^{i-1}, F[-2])$  is surjective. Hence  $\varprojlim^1 \mathcal{SH}(k)(E^i, F[-2]) = 0$ , and so

$$\mathcal{SH}(k)(E, F[-1]) = \mathcal{SH}(k)(\operatorname{colim} E^{i}, F[-1])$$

$$= \varprojlim \mathcal{SH}(k)(E^{i}, F[-1])$$

$$= 0.$$

We now establish property (3) of a t-structure. The functor  $(-)_{\leq 0}$  has already been defined. For  $k \in \mathbb{Z}$ , let  $(-)_{\leq k}$  is a functor on  $\operatorname{Spt}_s(k)$  and we may extend it to a functor on  $\mathcal{SH}(k)$  in the same way as for the case k=0. Define  $E_{\geq 0}$  to be the homotopy fiber of the canonical map  $E \to E_{\leq -1}$ . The long exact sequence of homotopy groups shows that  $(-)_{\geq 0}$  has the correct homotopy groups. The uniqueness of the triangle follows by properties of triangulated categories.

#### 3.7. The heart of the t-structure on $\mathcal{SH}(k)$ .

**Definition 3.24.** A homotopy module over k is a pair  $(M_*, \mu_*)$  consisting of a  $\mathbb{Z}$  graded strictly  $\mathbb{A}^1$  invariant sheaf  $M_*$  and an isomorphism  $\mu_n : M_n \cong (M_{n+1})_{-1}$ .

**Lemma 3.25.** If E is a bi-spectrum, then

$$R\Omega_t^{\infty}E \to \underline{\mathrm{Hom}}(\mathbb{G}_m, R\Omega_t^{\infty}(E \wedge \mathbb{G}_m))$$

is an isomorphism.

**Lemma 3.26.** Let  $E \in \mathcal{SH}(k)$ . For a fixed  $n \in \mathbb{Z}$ , the collection  $\pi_n(E)_m$  forms a homotopy module.

**Lemma 3.27.** If  $(M_*, \mu_*)$  is a homotopy module over k, then there is a  $(\mathbb{G}_m, S^1)$  bispectrum  $HM_*$  with  $(HM_*)_{n,n} = K(M_n, n)$  with evident structure maps.

**Theorem 3.28.** The heart of the t-structure  $(\mathcal{SH}(k), \mathcal{SH}(k)_{\geq 0}, \mathcal{SH}(k)_{\leq 0})$  is denoted  $\pi_*^{\mathbb{A}^1}(k)$  and is equivalent to the category of homotopy modules. The equivalence is given explicitly by the functors  $\pi_0(-)_*$  and H(-).
